

August 1998

TO: Parties interested in using ChemTec One

From: James W. Sist

Enclosed selected pages of a report compiled for the Cincinnati / Northern Kentucky International Airport on the performance of CHEMTEC ONE™ vs Hyrdozo Enviroseal Concrete sealer. This report was contracted by an independent third party to evaluate CHEMTEC ONE'S performance against a well known and widely used Silane Sealer.

ChemTec Int'l had NO input on the test that were performed or the method of testing. This report is an independent assessment of the true performance of ChemTec One vs the competition on low air entrained deteriorated concrete. Please note the coverage of ChemTec One vs manufactures recommended application rate. The performance of ChemTec One was quite impressive and beat the competition hands down. If the proper application rate had been achieved, the results would be even more impressive.

ChemTec One is one of the only Reactive Silicate Products that can perform both as a high performance commercial floor hardener (**in Wal-Mart Super Center, Sam's Club & Neighborhood Market Master Spec.**) and protect outside concrete infrastructures against severe weathering conditions. It is the only product of its kind at this time, that can meet and exceed the requirements set by the Ohio & Illinois DOT for using reactive silicates to protect concrete surfaces. The ODOT specification #841, is enclosed in the product booklet.

Sincerely,
ChemTec Int'l Inc.

PS: Please keep in mind that this lab is notorious for not liking sealers. Let the numbers speak for themselves
